

AP2 Given:
1.5m x .5m 2D space
list of actuators

Find:
Design to lift
max weight to
.5m

Plan:

- 1) Set up triangle design and pick actuator
- 2) Display in Excel
- 3) Sketch final design

Solution:

Actuator: RSX bc strongest Force, 294kN,
and stroke length, 1.5m, > than necessary
.5m.

L (length of bar) (m)	Angle (bar/ground angle @ h) (°)	x (x position of actuator) (m)	Tmax (max torque) (Nm)	Wmax (max weight) (N)	h (max lift height) (m)
0.5	90	0	0	294	0.5
0.6	56.44269024	0.331662479	97.50876884	294	0.5
0.7	45.5846914	0.4898979486	144.0299969	294	0.5
0.8	38.68218745	0.6244997998	183.6029412	294	0.5
0.9	33.7489886	0.7483314774	220.0094543	294	0.5
1	30	0.8660254038	254.6114687	294	0.5
1.1	27.03569179	0.9797958971	288.0599938	294	0.5
1.2	24.62431835	1.090871211	320.7161362	294	0.5
1.3	22.61986495	1.2	352.8	294	0.5
1.4	20.92483243	1.307669683	384.4548868	294	0.5
1.5	19.47122063	1.414213562	415.7787873	294	0.5

3) From the above data we can see the ideals are as follows

$$x = 1.41 \text{ m}$$

$$L = 1.5 \text{ m}$$

$$\theta_{\max} = 19.47^\circ$$

Reflection:

I think this design is best, because it makes sure that the actuator should be close to the load
